## What is a Johnson Pacemaker?

A Johnson pacemaker is a medical device designed to regulate heartbeats in individuals with arrhythmias, which are irregular heartbeats. This device sends electrical impulses to the heart muscle, prompting it to beat at a normal rate. Johnson pacemakers are renowned for their reliability, advanced technology, and user-friendly design.

## Types of Johnson Pacemakers

There are several types of Johnson pacemakers, each tailored to meet specific patient needs:

### 1. Single-Chamber Pacemaker:

- It is typically used for patients with bradycardia, where the heart beats too slowly.

### 2. Dual-Chamber Pacemaker:

- This device has two leads, one in the right atrium and one in the right ventricle.
- It helps coordinate the timing of heartbeats between the chambers, making it suitable for more complex heart conditions.

### 3. Biventricular Pacemaker:

- Also known as cardiac resynchronization therapy (CRT), this type has leads in both ventricles.
- It is designed for patients with heart failure and helps improve the heart's efficiency.
