- Reduced emissions

### 2. Turbocharging and Intercooling

Turbochargers compress incoming air, allowing for more air to enter the engine, which leads to better combustion and increased power. Coupled with intercooling, which cools the compressed air before it enters the cylinders, these systems improve overall engine performance while maintaining lower emissions.

### 3. Exhaust Aftertreatment Systems

Modern diesel engines are equipped with advanced exhaust aftertreatment systems, such as Diesel Particulate Filters (DPF) and Selective Catalytic Reduction (SCR). These systems significantly reduce harmful emissions by:

- Capturing soot and particulates
- Converting nitrogen oxides (NOx) into harmless nitrogen and water
